0.0.1 Final Class Exercise: Library Borrowing (using key-value)

You are given a dictionary that shows how many books each student has borrowed. Write a Python program to: 1. Print the names of students who borrowed more than 2 books. 2. calculate the total number of borrowed books.

```python
[10]: borrowed_books = {
          'Ali': 1,
          'Sara': 3,
          'Reza': 0,
          'Lina': 4,
          'Omid': 2
      }

      # write your answer here part 1
      over_threshold = 2

      print("People who borred more than two books:")
      for name, number in borrowed_books.items():
          if number > over_threshold:
              print(name)

      # write your answer here part 2
      print( )
      total = sum(borrowed_books.values())
      print(total)
```

```
People who borred more than two books:
Sara
Lina

10
```

```
[ ]:
```
